File formats AutoCAD Serial Key and AutoCAD LT only store the geometry of drawings in 2D and 3D. They do not store any information about layers and their properties. This means that layers are not supported by these programs and no layers can be hidden or made visible. Instead of layers, there is a built-in option to show or hide various objects in the drawing. Structure editing AutoCAD features a graphical structure editor, which allows the direct manipulation of the structure of an object, which can be a single or a group of objects, such as the selection of an object in a group or the deletion of an object in a group. The following screen shots show the graphical user interface of the structure editor in AutoCAD LT. The actions of the button controls are explained in the descriptions below the button controls. The window has six tabs, each containing a section of controls. Groups and selection The auto-grouping feature, present in AutoCAD since Release 18, allows the user to automatically group a series of connected objects into a single shape, eliminating the need to manually connect the objects with line segments. Other features that are available in AutoCAD are: Bounding box editing The bounding box editing feature in AutoCAD can be used to quickly sketch the dimensions of the bounding box of the selected object. By default, the bounding box is created in a fashion that enables it to show its smallest dimension to make it easier for the user to see the bounding box. The bounding box

editor can also be used to draw out boxes and rectangles around the area of a selected object. The bounding box editing is especially useful for creating virtual measurement points as it automatically creates the boxes around the physical objects. The bounding box can be expanded to see the size of the boxes. The bounding boxes can be copied, deleted, rotated and moved around the work area. The bounding box editing is also available in AutoCAD LT in the Windows ribbon's Tools ribbon.

Dimensions The dimensions feature in AutoCAD allows the user to create custom-named dimensions with custom properties such as an axis, which is used to define a view in which the dimension is oriented. The dimensions feature allows the user to draw dimensions on the drawing and also view the dimensions of the currently selected objects. The objects that have dimensions are also displayed in the dimensions view. The dimensions can also be grouped into families. The a1d647c40b
